

Encryption Security Solutions

encryptoOBE™ Best in Class Security Products

Businesses constantly struggle to keep their information safe. Just read the newspaper and it becomes obvious that the property crime rate has risen throughout the United States. Over the past year, our clients have reported more office break-ins or parking lot smash & grabs than in prior years. In light of this fact, we are excited to offer products and services that will help you keep your data safe. It begins by developing a disaster recovery plan.

There are two main questions to consider when creating a disaster recovery plan:

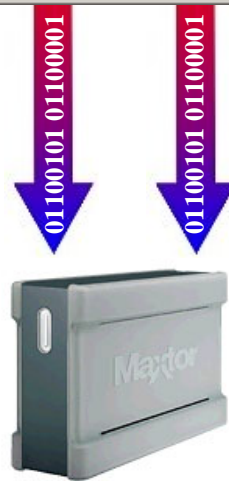

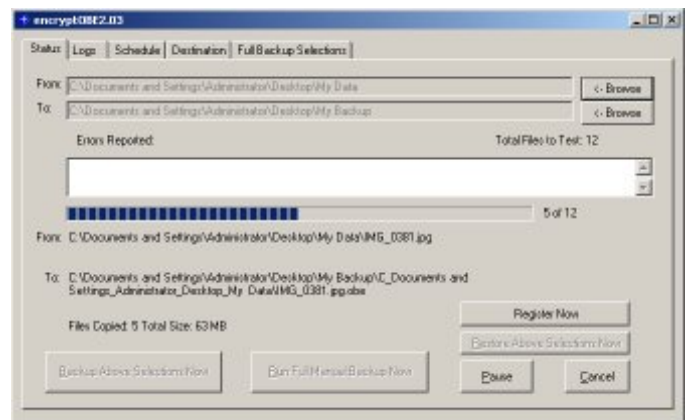

1) Do you have a backup plan should your server, computer or laptop fail?

A good disaster recovery plan, enables an organization to quickly restart operations in the event of a human-caused event or natural disaster. We recommend using encryptoOBE, which is a backup encryption program used to automatically backup your data. encryptoOBE uses external, removable hard drives to backup your data and is designed to backup any software package. You can automatically backup any software program or database including Quickbooks, any Word documents, PDF files, database files, etc. In practice, one hard drive is connected to the server via USB port and a second hard drive is kept off site as a daily backup. A third hard drive is recommended and is kept off site as a monthly backup.

When using tapes and in the event of a failure the server must be fixed prior to restoring the backup, increasing the total amount of downtime. Using encryptoOBE with removable hard drives, should your server fail for any reason, this allows you to quickly restore your data on another machine by simply plugging in the USB or Firewire external hard drive backup.

2) Is your data secure should your backup fall into the wrong hands?

Backup encryption is a very important step in protecting your data. When completing a backup, you want to ensure an outside party cannot gain access to the data on the external hard drive should it inadvertently fall into the wrong hands. encryptoOBE™ is a file encryption program that backs up data using external, removable hard drives. As your data is copied to the external hard drive, the data is securely encrypted. If your backup hard drive is lost or stolen, your information cannot be compromised because your data will be encrypted securely giving you piece of mind. encryptoOBE's™ 256 bit encryption offers security for all confidential information.
